

Anatomical boundaries and immaterial objects

Stefan Schulz

Department of Medical Informatics
University Hospital Freiburg (Germany)

Is the fly inside or outside her body ?

Problem (I)

- Biological objects need clearly defined boundaries to enable assertions parthood and location
- Most Biological objects are sponge-like (full of vessels, capillaries, cavities, holes and other hollow spaces)

Problem (II)

- Many cavities communicate with the exterior space (e.g. respiratory system)
- Common conceptualization (cf. biomedical terminologies): biological objects have immaterial parts, eg. Lumen of esophagus, alveolar lumen, many cavities and holes in bones, ...

How to deal with hollow spaces ?

H is part of E, hence B is located **outside** of S

H is part of S, hence B is located **inside** of S

Problem

- Inside or outside ?
- Example: Bronchi
A foreign body in a bronchus is in the lung
- Strict topological view conflicts with shared conceptualization

Where to delimit ?

1. All hollow spaces are part of the exterior...

... but nothing can be located inside...

2. Those hollow spaces which communicate with the exterior are part of the exterior space...

... what if some spaces only temporarily communicate ?

4. The complete convex hull is part of the object...

... then the body would practically spatially coincide with the vascular system !

3. Only those hollow spaces which are containers something are part of the exterior space...

... how to ascertain whether they are containers ?

Anatomists draw fiat boundaries

Surface structures which have a name are considered to be inside the organ

**L2 vertebra:
superior view**

Intervertebral disc

L3 and L4 vertebrae:

Lumbar vertebrae, assembled:

F. Netter M.D.

Algebraic Properties: *Part-Of* / *Has-Part* vs. *part-of* / *has-part*

■ Instance level :

$part-of(a, b), part-of(b, c) \rightarrow part-of(a, c)$ **Transitivity ?**

$part-of(a, b) \rightarrow \neg part-of(b, a)$ **Asymmetry**

$part-of(a, b) \rightarrow a \neq b$ **Irreflexivity ?**

$part-of(a, b) \rightarrow has-part(b, a)$ **Inverse Relation**

■ Class level*:

$Part-For(A, B), Part-For(B, C) \rightarrow Part-For(A, C)$

$Part-For(A, B) \rightarrow \neg Part-For(B, A)$

$Part-For(A, B) \rightarrow \neg Is-A(A, B)$ **?**

$Part-For(B, A)$ does not necessarily imply $Has-Part(A, B)$

$Possible-Part(B, A)$ implies $Has-Possible-Part(A, B)$

(...)

Part-Of in Anatomies:

Consensus required about

- Domain and range of part-of relations
- Algebraic properties of part-of relations
- Intended meaning of part-of relations in the domain of biology and medicine

Different notions of part-of

- Time-independent:
 - Compositional
 - Functional
 - Topological
- Time-dependent:
 - *a part-of b* at any point of time →
a part-of b at every point of time
 - *a part-of b* at one point of time,
a NOT part-of b at another point of time

Different notions of part-of

- Time-independent:

- Compositional

- Functional

- Topological

- Time-dependent:

- *a part-of b* at any point of time →
a part-of b at every point of time

- *a part-of b* at one point of time,
a NOT part-of b at another point of time

Parts as Components

Parts “build”
the whole

part-of (Finger, Hand)

part-of (Bone Marrow, Bone)

part-of (Sodium Ion, Cytoplasm) ?

part-of (Sarcomer, Muscle)

part-of (Heart, Human Body)

“Intuitive” notion of part. Controversial

Different notions of part-of

- Time-independent:

- Compositional

- Functional

- Topological

- Time-dependent:

- *a part-of b* at any point of time →
a part-of b at every point of time

- *a part-of b* at one point of time,
a NOT part-of b at another point of time

Parts as Functional Components

Part contributes to the function of the whole

part-of (Finger, Hand)

part-of (Lymph Node, Lymphatic System)

part-of (Cell Nucleus, Cell)

part-of (Tendon, Muscle)

part-of (Tooth, Jaw)

More restricted, may conflict with notions of connection

Different notions of part-of

■ Time-independent:

- Compositional

- Functional

- Topological

no clear distinction !

■ Time-dependent:

- *a part-of b* at any point of time →
a part-of b at every point of time

- *a part-of b* at one point of time,
a NOT part-of b at another point of time

Different notions of part-of

- Time-independent:

- Compositional
- Functional
- Topological

- Time-dependent:

- *a part-of b* at any point of time →
a part-of b at every point of time
- *a part-of b* at one point of time,
a NOT part-of b at another point of time

Continuous exchange of matter

Endosymbiont Hypothesis

2.5 billion years ago:
Primitive cell with
bacterium-like symbionts

Today:
Chloroplasts (Plants)
Mitochondria

Are the organelles part of the cell

■ Which eggs are part of the body ?

Topological parts

Located within the boundaries
of an object

part-of (Mitochondrion, Cell)

part-of (Brain, Head)

part-of (Brain, Cranial Cavity) ?

part-of (Ovum, Oviduct) ?

part-of (Finger, Hand)

part-of (Amount of Blood, Right Ventricle) ?

has-location instead of *part-of* ?

Topological parts

Located within the boundaries
of an object

has-location (Mitochondrion, Cell)

has-location (Brain, Head)

has-location (Brain, Cranial Cavity)

has-location (Ovum, Oviduct)

has-location (Finger, Hand)

has-location (amount of Blood, Right Ventricle)

has-location as a mereotopological primitive ?

Topological parts

How to deal with hollow spaces ?

H is part of E, hence B is located **outside** of S

H is part of S, hence B is located **inside** of S

Example

- Inside or outside ?
- Example: Bronchi
A foreign body in a bronchus is in the lung
- Strict topological view conflicts with shared conceptualization

Different notions of part-of

- Time-independent:

- Compositional
- Functional
- Topological

- Time-dependent:

- *a part-of b* at any point of time →
a part-of b at every point of time
- *a part-of b* at one point of time,
a NOT part-of b at another point of time

Example: Transplantation

Example: Transplantation

Phagocytosis / Digestion

Secretion

Conclusion

- Part-of: example, how many different interpretations co-exist
- Standardization: need to eliminate ambiguity by precise characterization of foundational primitives (properties, relations)
- Solid theoretical basis is needed, e.g. mereotopology: Simons, Casati, Smith, Varzi,...
