Ontologies, Terminologies, Information Models & Knowledge Repositories in DEBUGIT

UNIVERSITÄTS
FREIBURG **KLINIKUM**

Terminology

Ontology

bla bla bla

Terminology

Set of terms used in a particular subject field.

Ontology

Precise formulation of the properties and relations of entities relevant for a particular subject field.

- *Concept Hepatitis:*

*{Hepatitis (D),
Leberentzündung (D),
hepatitis (E), hépatite (F)}*

Terminology

Set of terms used in a particular subject field.

- *Type: Hepatitis:*

- *Description:
"Every hepatitis is an
inflammatory disease that is
located in **some** liver"*

Ontology

Precise formulation of the properties and relations of entities relevant for a particular subject field.

Clinical Knowledge Repository

Generalized domain knowledge:

- Different degrees of evidence
- Controversial, hypothetical
- Probabilistic

Terminology

Ontology

Repository of clinical data
of individual patients:

- observer / method dependent
- fuzzy, speculative, uncertain
- diagnostic hypotheses confirmed
or ruled out

Information Models

Clinical Knowledge

*Viral Hepatitis
has signs & symptoms....
has epidemiology...
has prognosis...
is treated with...*

Concept Hepatitis:

Meaning of the terms

{Hepatitis (D), Leberentzündung (D), hepatitis (E), hépatite (F)}

Type Hepatitis:

*$\forall x: \text{instanceOf}(x, \text{Hepatitis}) \Leftrightarrow \text{instanceOf}(x, \text{Inflammation}) \wedge$
 $\exists y: \text{instanceOf}(y, \text{Liver}) \wedge \text{hasLocation}(x, y)$*

Terminology

Ontology

Patient X:

At admission:

fever, jaundice,

hepatomegaly:

suspected viral hepatitis,

Models

Clinical Knowledge Repository

Terminology

Provides
semantic
identifiers

Ontology

Provides
semantic
identifiers

Information Models

Clinical Knowledge Repository

Terminology **Clinical** Ontology
Vocabularies

Information Models

The role of the Ontology in DEBUGIT

- Shared language-independent semantic reference
- Used by Information Model and Knowledge repository
- Linked to multilingual terms where necessary
- First steps
 - Delimit conceptual scope
 - Create DEBUG-IT ontology re-using (and linking to) existing sources, especially SNOMED
 - Tools: Protégé
 - Representation language: OWL-DL
