Biomedical Ontologies

*Fourth Interdisciplinary School on Applied Ontology (ISAO 2018)
10-15 September 2018, Cape Town, South Africa*

Goals of the lectures

- Data management in biomedical research and health care
- Overview of the entities of interest this area
- Practice “ontological thinking”
- Catch up with previous knowledge on ontology and logic
- Discuss specific ontological challenges in this domain
- Distinguish ontologies from other semantic artefacts

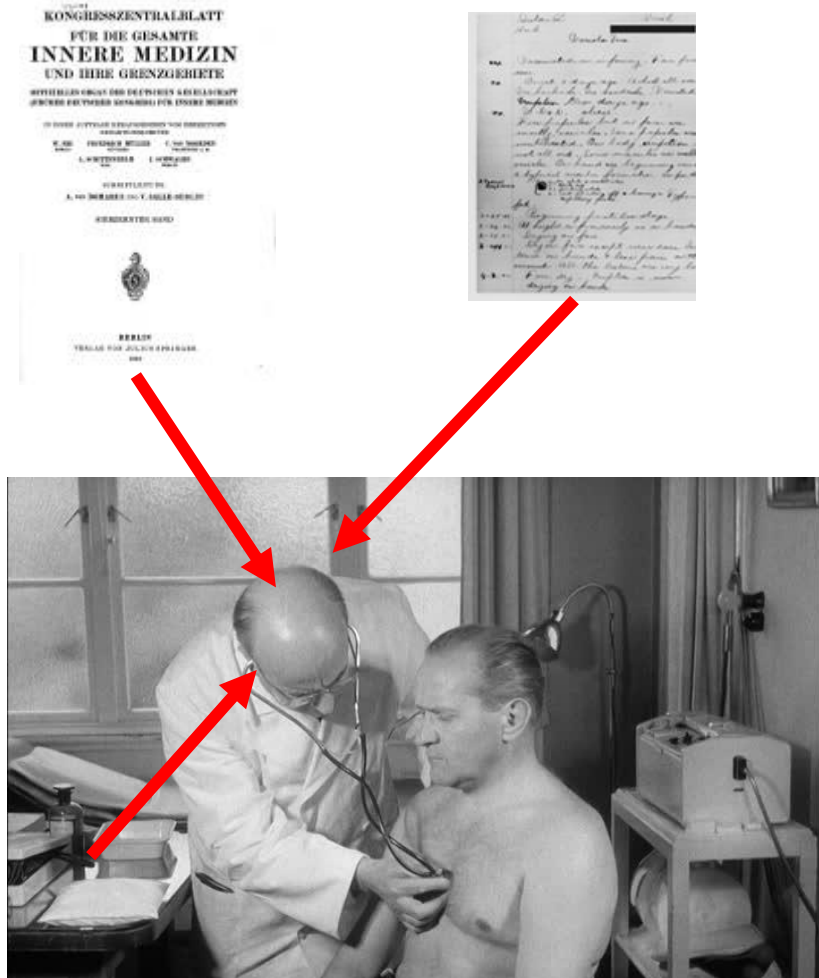

The scope: biomedical research & health care

- Health
 - Crucial resource for well being
 - More than absence of disease
- Health care / medicine:
 - one of the world's largest and fastest-growing industries
 - > 10 percent GDP of most developed countries
- Beyond care:
 - health involves all aspects of life, e.g. diet, exercise, occupational safety
- Beyond humans: veterinary medicine

The scope: biomedical research & health care

- Biology
 - Science that studies life and living organisms
 - Genes → Molecules → Cells → Organisms → Populations → Ecosystems
- Biomedical Science:
 - Application of biology and other natural science for diagnosis, prevention and treatment of diseases
 - Important application: pharmaceutical industry
 - total pharmaceutical revenues worldwide > 1 Trillion \$
 - Cost of bringing new drug to market: > 1 Billion \$

Data in health care

What has changed since then?

Technology (r)evolution

Human brain 2018

Knowledge explosion

MEDLINE-indexed articles published per year

Data in health care

- Electronic health records
 - Substitute of traditional paper chart
 - Serve different purposes
 - Documenting the patient's history and progress
 - Legal requirements
 - Communication between physicians, nurses
 - Coding for billing / reimbursement
 - Special documentation
 - Clinical trials
 - Patient registries
 - Quality control

Most clinical data is free text

```
01 CHEST, PORTABLE 1 VIEW
02 INDICATION:
03 Shortness of breath
04 COMPARISON: July 16 10 recent prior
05 FINDINGS:
06 Left central line, tip at mid-SVC.
07 Cardiac and mediastinal contours as before
08 No pneumothorax.
09 Lungs: Interval increase in right lung base
10 pulmonary opacity with air bronchograms,
11 increasing pneumonitis / atelectasis.
```

Paciente cardiopatia isquemico, com CRM prévia, interna para realizar ACTP + stent em ACD, via ponte de safena. Procedimento realizado com sucesso e sem intercorrências.

Planning Nieuwe afspraak binnen 6 maanden met vroegere voorafgaande adipositascontroles . De patiënte moet ook PTH , folaten en cobalamine laten controleren bij labo - onderzoeken , ze doet die zelf aangezien ze verpleegster is in de provindie provincie Skåne . Moet de inname van calciumtabletten naar 3 per dag verhogen (momenteel slechts een per dag). Binnen 3 maanden nieuwe controle van 25- OH - vitamine D3- controle , inclusief PTH en vloeistofhuishouding . Code diagnose / behandeling Hoofddiagnose : Z090, halfjaarlijkse controle na gastric bypass wegens obesitas

Which are the advantages / disadvantages of free text in clinical documentation?

Structured clinical data

Lab results

Lab	Result	Normal value
AM ACTH	<1.1 pg/mL	7.2-63.3 pg/mL
AM cortisol	<0.8 µg/dL	4-20 µg/dL
30-min post-cosyntropin	9.5 µg/dL	
1-hour post-cosyntropin	11.2 µg/dL	
LH	0.3 mU/mL	1-8 mU/mL
Testosterone	<20 ng/dL	300-1,200 ng/dL
Prolactin	1 ng/mL	0-17 ng/mL
SHBG	40.2 nmol/L	19.3-76.4 nmol/L
Free T ₄	0.61 ng/dL	0.8-1.8 ng/dL
Total T ₃	59 ng/dL	75-165 ng/dL

What's the interest of physicians to fill such forms on paper or on screen?

Quality problems with clinical data

- Textual data relatively accurate and complete, tailored to human readers but difficult to analyze: NLP (natural language processing systems) have to deal with multiple sublanguages and poor editing
- Structured data often not linked to international semantic standards (controlled vocabularies, ontologies)
- Limited motivation to generate good quality data:
 - Wherever users are not beneficiaries of data
 - Wherever users have to record data redundantly
- Known biases:
 - Collecting data for billing / reimbursement
 - Collecting data for quality management

Paclitaxel resistance

Breast cancer

ABSTRACT

Elevated expression of HER3, which interacts with HER2 in breast cancer cells, confers chemoresistance via phosphoinositide 3-kinase (PI-3K)/Akt-dependent upregulation of Survivin. However, the underlying mechanism is not clear. Ectopic expression or specific knockdown of HER3 in HER2-overexpressing breast cancer cells did not alter *Survivin* mRNA levels and Survivin protein stability, supporting the notion that HER3 signaling may regulate specific miRNAs that target *Survivin* to alter its protein translation. Here we showed that overexpression and specific knockdown of HER3 reduced and enhanced expression of two *Survivin*-targeting miRNAs, miR-203 and miR-542-3p, in breast cancer cells, respectively. While the specific inhibitor of either miR-203 or miR-542-3p attenuated an anti-HER3 antibody-induced downregulation of Survivin, inhibition of miR-542-3p exhibited a better efficacy than miR-203 inhibition did. Consistently, miR-542-3p mimic was much more effective than miR-203 mimic not only in inhibition of Survivin, but also in enhancement of paclitaxel-induced apoptosis in HER2-overexpressing breast cancer cells. Moreover, the combination of miR-542-3p mimic and paclitaxel, as compared with either agent alone, significantly inhibited *in vivo* tumor growth of HER2-overexpressing breast cancer cells. Collectively, our data indicated that the HER3/PI-3K/Akt signaling upregulates Survivin via suppression of miR-203 and miR-542-3p. Because miR-542-3p has three binding sites on the 3'-UTR of *Survivin* mRNA, its mimic was able to effectively downregulate Survivin *in vitro* and *in vivo*. Thus, miR-542-3p-replacement therapy is an excellent approach to overcome HER3-mediated paclitaxel resistance and significantly enhances the antitumor activity of paclitaxel against HER2-overexpressing breast cancer.

Data in biomedical sciences

- Experiments require precise documentation
 - Clinical trials use own data acquisition standards and tools
 - Lab experiments increasingly publish not only papers but also datasets
 - Primary source of scientific data peer-reviewed publications
 - On-line available
 - > 25 million abstracts via Pubmed / MEDLINE
 - Millions of full texts

Biomedical databases

- Typical questions
 - Which genes / proteins in which organism are related to which biological processes
 - Which structure and functions do they have?
 - In which biochemical pathways are they related to which molecules?
 - Which genetic defects are related to which diseases?
 - Structured extracts of publications go into research databases, e.g. Uniprot, Ensembl, Reactome
 - By the authors
 - By NLP-based algorithms
 - By database curators

Protein | **Receptor tyrosine-protein kinase erbB-2**

Gene | **ERBB2**

Organism | *Homo sapiens (Human)*

Status |  Reviewed - Annotation score: ●●●●● - Experimental evidence at protein levelⁱ

Functionⁱ

Protein tyrosine kinase that is part of several cell surface receptor complexes, but that apparently needs a coreceptor for ligand binding. Essential component of a neuregulin-receptor complex, although neuregulins do not interact with it alone. GP30 is a potential ligand for this receptor. Regulates outgrowth and stabilization of peripheral microtubules (MTs). Upon ERBB2 activation, the MEMO1-RHOA-DIAPH1 signaling pathway elicits the phosphorylation and thus the inhibition of GSK3B at cell membrane. This prevents the phosphorylation of APC and CLASP2, allowing its association with the cell membrane. In turn, membrane-bound APC allows the localization of MACF1 to the cell membrane, which is required for microtubule capture and stabilization.  Curated

In the nucleus is involved in transcriptional regulation. Associates with the 5'-TCAAATTC-3' sequence in the PTGS2/COX-2 promoter and activates its transcription. Implicated in transcriptional activation of CDKN1A; the function involves STAT3 and SRC. Involved in the transcription of rRNA genes by RNA Pol I and enhances protein synthesis and cell growth.  3 Publications ▾

Exercise (I)

- Use the following upper-level categories:
Material entity, immaterial physical entity, quality, role, realizable (disposition, function), process, information entity, temporal region
- Try to relate biomedical terms to these categories
- Decide whether they denote subclasses or instances (individuals)
- Discuss additional aspects like granularity and cardinality
- Are there conflicting categorizations?

Exercise (II)

- Sample terms:
“cranial cavity”, “aspirin”, “road traffic accident”, “liver function”, “headache”, “social security number”, “mouse embryo”, “blood”, “carbon atom”, “red”, “persecutory delusion”, “Groote Schuur Hospital”, “nurse”, “American College of Rheumatology recommendations for the treatment of early rheumatoid arthritis”, “death”, “acute”, “tooth extraction”, “species homo sapiens”, “39.9°C”, “Ibuprofen 300 mg Capsule”, “admission diagnosis”, “tonsillectomy”, “World Health Organisation”, “malaria”, “gunshot injury”, “DNA”, “phenotype”, “Gene”, “colon cancer”, “life”, “insulin”, “hospital”, “white blood cell”, “body mass (in kg)”, “risk of breast cancer”, “patient”

Biomedical entities walkthrough

- Ontological analysis:
 - Inventory of middle level classes ?
 - Categorization: upper level classes ?
 - Properties: what do they have in common?
 - Relations: how can they be related?

Material entities and immaterial spaces (I)

- By increasing cardinality:
 - Atoms, ions, small molecules, e.g. Calcium, Glucose
 - Macromolecules, e.g. proteins, nucleic acids (RNA, DNA)
 - Parts of macromolecules, e.g. gene sequences, protein sequences
 - Molecule complexes, e.g. chromatin, chromosomes
 - Cells, cell components and intracellular spaces, e.g. white blood cell, mitochondrion, cell nucleus, cell membrane, intracellular space.
 - Anatomical entities: tissues, organ parts, organs, organ systems
 - Organisms, unicellular (e.g. bacteria), multicellular
 - Populations, cohorts

Material entities and immaterial spaces (II)

- Non-biological material entities of biomedical interest:
 - Synthesised molecules (drugs)
 - Lab devices
 - Medical devices, implants
 - Medical equipment, vehicles, buildings etc.
- Non-material physical entities
 - Geographical region
 - Habitat

Material entities and immaterial spaces (III)

- Other aspects
 - Homomericity: part is of the same type: amount of water, amount of brain tissue etc.
 - Single objects vs. collections of same object, e.g. aspirin molecule, vs. amounts of aspirin molecules - but distinct from aspirin tablet!
 - Monomers vs. polymers: example carbohydrates, nucleic acids, proteins

Which relations are typical for this kind of entities ?

Processual entities (I)

- At level below organisms
 - At molecular level: modification, transport, signal transmission, regulation of activities, e.g. gene regulation, control of transcription
 - At cellular level: mitosis, meiosis, cell death, propagation of impulses through nerves,...
 - At tissue level: immune processes
 - At level of organs and organ systems: motion, circulation, neuromuscular processes, digestion, respiration, wound healing , ...

Processual entities (II)

- With human agents on biological objects:
 - laboratory processes, omics analyses
 - Therapeutic interventions, diagnostic interventions, observing, interpreting, documenting, diagnosing, prescribing drugs, therapies
 - Health system processes: admission, discharge, billing, reimbursement, training, certification ,...
 - Lifestyle, physical exercise

Which relations are typical for processual entities ?

Realisables

- Realisables exist even if not realised.
 - Ability to interact on a molecular level
 - Ability to perform cell division
 - Ability to kill pathogens
 - Ability to explode
 - Disposition of a bone to break
 - Reproductive function
 - Function of pumping blood
 - Walking function
 - Risk of breast cancer
 - Ability to lactate

Which relations are typical for realisables? How are they related to material objects, how to processes?

Roles

- The role of a solvent
- The role of a substrate in a chemical reaction
- The role of a patient / of a health professional
- Employer / employee
- Parent, child, sibling,...
- (Social) gender, ethnicity
- The role of a predator / prey
- Catalyst, enzyme
- Roles in processes: active participant / passive participant / input / output
- Food as a role of a certain amount of biological matter

Which relations are typical for roles?

Qualities

- Physical qualities: weight, mass, electric charge, temperature
- Qualities of processes, e.g. evolution of a disease process
- Species quality, e.g. being a human, a fish, a mushroom
- Canonicity, i.e. normal / abnormal, pathologic
- Shapes

Which relations are typical for qualities entities ? How are they distinguished from realisables?

Information content entities

- Epistemology vs. ontology
- Image, e.g. X-ray
- Plans
- Thoughts, beliefs, opinions, cultural / individuals
- Results of speech acts
- Documents, i.e. results of documentation acts
- Results of observations, measurements
- Medical diagnosis, prognosis

Which relations are typical for information content entities ?

Social entities

- Associations, corporations, institutions, families
- E.g. hospital, school, lab, insurance company,

Which relations are typical for social entities ?

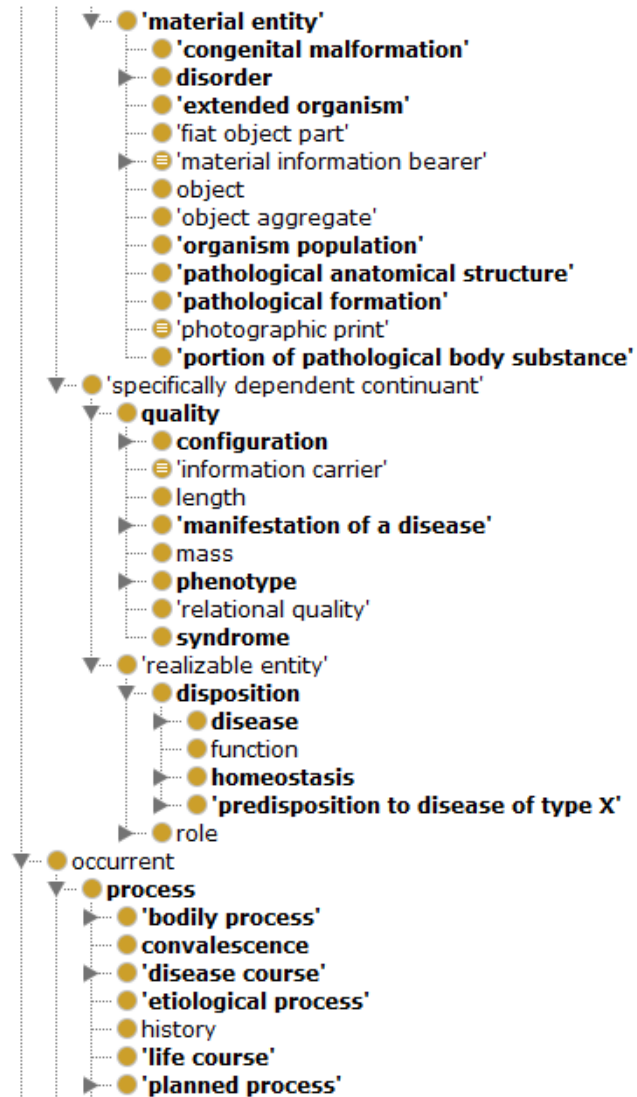

Entity types with multiple or debatable assignment to upper-level classes (I)

- Diseases, disorders: What do a pneumonia, a club foot, a femur fracture, a seizure, an ulcer, a colon cancer have in common?
- Related entities,
 - E.g. genetic disposition -> manifestation
 - e.g. cause / mechanism of an injury -> morphology -> process
- Experiences, e.g. symptoms (individual perception of body dysfunction)?
- Delusions?

Entity types with multiple or debatable assignment to upper-level classes (II)

- What is the difference between the normal and the pathological?
E.g. alopecia, vitiligo, lifestyle preferences, uncommon behaviour, ageing?
- Is this ontologically significant?
- Socioeconomic conditions
- Environment
- System
- Juridical “person”

Example OGMS

- Ontology for general medical science
- <https://bioportal.bioontology.org/ontologies/OGMS>

- Clinical Information Models

Not all hierarchies are ontological

- Hierarchically structured information template
no taxonomic relations

Schulz S, Karlsson D, Daniel C, Cools H, Lovis C.
Is the "International Classification for Patient Safety" a classification?
Stud Health Technol Inform. 2009;150:502-6.

ICD – International Classification of Diseases

- A statistical classification of diseases, issued by WHO
Most recent release: **ICD-11 for Mortality and Morbidity Statistics** (2018)
Main building principles:
 - Single, mostly taxonomic hierarchies
 - Non-overlapping classes
- Rules to assure this principle:
 - E.g., Diabetes mellitus excludes Diabetes mellitus in pregnancy, which is in a different branch of the hierarchy
- “Residuals” like “other”, “unspecified”
- <https://icd.who.int/browse11/l-m/en>

MeSH – Medical Subject Headings

- Thesaurus for Literature Indexing in Retrieval, issued by the U.S. National Library of Medicine
- All MEDLINE literature records are manually annotated with MeSH concepts
- Multi-hierarchical (overlap of tree-like hierarchies), spans all areas of medicine and biology
- E.g. a paper indexed by “aspirin” and “stomach ulcer” would be found in a query with “antipyretics” and “gastrointestinal diseases”
- <https://www.ncbi.nlm.nih.gov/mesh/>

SNOMED CT

- Ontology-based terminology for representing content of the electronic health record
- Run by an international standards organisation, requires licence for clinical use
- Distributed in a tabular form, can be transformed into OWL – EL
- Has its own OWL-like compositional syntax
- Some semantic issues unresolved
- <http://browser.ihtsdotools.org/>

- ☰ Pancreaticojejunostomy (procedure)
- ● Pancreaticojejunostomy, side-to-side anastomosis (procedure)

SNOMED CT – Structural benefits (I): Polyhierarchies

SNOMED CT – Structural benefits (II): Co-ordination

Pre-coordination

"Verbrennung 2. Grades eines einzelnen Fingers"

```
211908006 |Deep partial thickness burn of a single finger (disorder)|
```

≡

```
<<< 29673001 |Second degree burn of single finger, not thumb (disorder)| :  
{ 116676008 |Associated morphology| = 262588000 |Deep partial thickness burn  
(morphologic abnormality)|, 363698007 |Finding site| = 56213003 |Skin of  
finger (body structure)| }
```

Post-coordination

"Verbrennung 2. Grades der Rückseite des rechten Zeigefingers"

```
<<< 29673001 |Second degree burn of single finger, not thumb (disorder)| :  
{ 116676008 |Associated morphology| = 262588000 |Deep partial thickness burn  
(morphologic abnormality)|, 363698007 |Finding site| = 37314006 | Skin  
structure of dorsal surface of index finger (body structure) |, 272741003  
|Laterality| = 24028007 |Right (qualifier value)| }
```

The diagram features a central green circle containing the text "SNOMED CT". This central circle is surrounded by seven other circles of varying sizes, alternating in color between red and green. These surrounding circles are arranged in a ring around the center. The entire arrangement of circles is enclosed within a dashed black circular border. The background of the slide is a photograph of a pond with many goldfish swimming in green water.

SNOMED CT

Information models

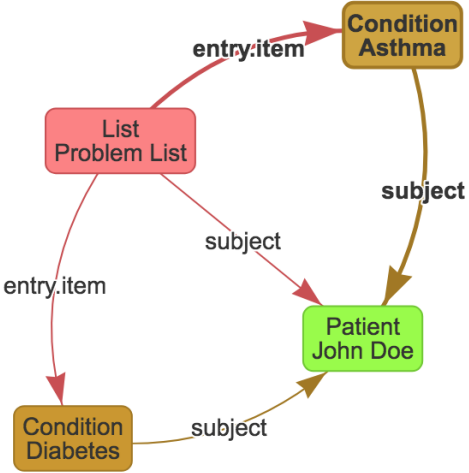

- “models of use” vs. “models of meaning”
- Recording templates for health care

Example: "concept" in information models
